

La gestione della bronchiolite Il nuovo documento intersocietario

Renato Cutrera
Dir. U.O.C. Broncopneumologia
Dipartimento Pediatrico Universitario Ospedaliero
(Prof. P. Rossi)
Ospedale Pediatrico Bambino Gesù IRCCS - Roma

- infants less than 12 months
- first attack
- brief prodrome

- wheezing
- dyspnea
- respiratory distress
- poor feeding
- tachypnea
- rx hyperaeration of the lung
- fine crepitation

- ✓ RSV bronchiolitis is the primary cause of hospitalisation in the first year of life for children in most parts of the world.
- ✓ In USA the virus is estimated to cause 3000 to 4000 deaths annually (Ogra PL, Paediatr Respir Rev 2004).

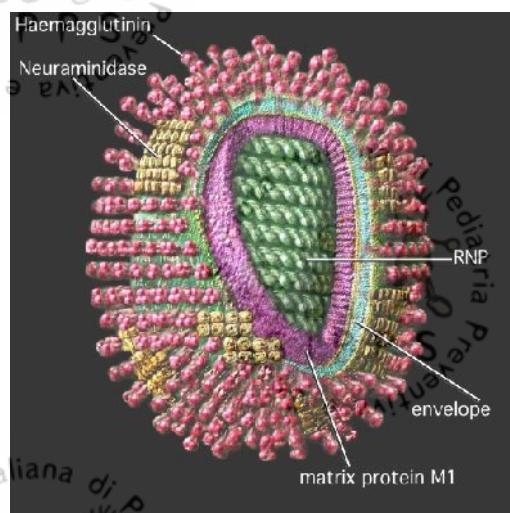

Physiological reasons for the increased susceptibility of infants for respiratory compromise in comparison to adults

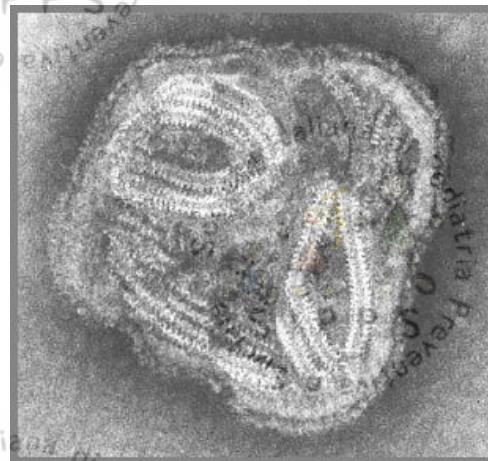

Cause	Physiological or anatomical basis
Metabolism ↑	O ₂ consumption ↑
Risk of apnoea ↑	Immaturity of control of breathing
Airway resistance ↑	Nose breathing Large tongue Airway size ↓ Collapsibility ↑
Upper airway resistance ↑	Pharyngeal muscle tone ↓ Compliance of upper airway structures ↑
Lower airway resistance ↑	Airway size ↓ Collapsibility ↑ Airway wall compliance ↑ Elastic recoil ↓ Numbers of alveoli ↓ Lack of collateral ventilation
Lung volume ↓	Efficiency of diaphragm ↓ Rib cage compliance ↑ Horizontal insertion at the rib cage
Efficiency of respiratory muscles ↓	Efficiency of intercostal muscles ↓ Horizontal ribs Respiratory rate ↑ Fatigue-resistant type I muscle fibres ↓
Endurance of respiratory muscles ↓

Domande

Lo ricovero?

Criteri per l’Ospedalizzazione

Most infants with acute bronchiolitis will have mild disease and can be managed at home with primary care support. Parents/care givers should be given information on how to recognise any deterioration in their infant’s condition and asked to bring them back for reassessment should this occur.

Any of the following indications should prompt hospital referral/acute paediatric assessment in an infant with acute bronchiolitis or suspected acute bronchiolitis:

- poor feeding (<50% of usual fluid intake in preceding 24 hours)
- lethargy
- history of apnoea
- respiratory rate > 70/min
- presence of nasal flaring and/or grunting
- severe chest wall recession
- cyanosis
- oxygen saturation ≤ 94%
- uncertainty regarding diagnosis.

Clinicians assessing the need to refer (or review in primary care) should also take account of whether the illness is at an early (and perhaps worsening) stage, or at a later (improving) stage.

**Kevin, maschio, caucasico, 2m.
La famiglia e' agitata, b nato a termine, buon accrescimento finora, non problemi conosciuti sottostanti.**

Da 2 giorni raffreddore. Da oggi t febbre (38° C max),

**Respira male, rientramenti intercostali e al giugulo
Alitamento pinne nasale FRda sveglio 60/min, SaO₂:92 % non cianosi.**

Torace rantoli crepitanti e sibili

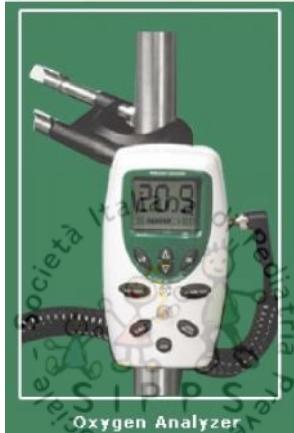

prende latte materno e mangia con difficoltà

Domande

Lo ricovero? SI

Ossigeno?

Lo metto in flebo?

Ossigenoterapia e monitoraggio

- ✓ Se saturazione di O₂ (SaO₂) ≥ 92% in aria no monitoraggio (D)
- ✓ O₂ per mantenere SaO₂ almeno 92 %
- ✓ Se ossigenoterapia, monitoraggio SaO₂
- ✓ Ossigeno, umidificato e riscaldato NHFO₂T ?
- ✓ Monitoraggio nei bambini più piccoli (apnee centrali)

Clinical Practice Guideline: The Diagnosis, Management, and Prevention of Bronchiolitis

OXYGEN

Key Action Statement 6a

Clinicians may choose not to administer supplemental oxygen if the oxyhemoglobin saturation exceeds **90%** in infants and children with a diagnosis of bronchiolitis (Evidence Quality: D; Recommendation Strength: Weak Recommendation [based on low-level evidence and reasoning from first principles]).

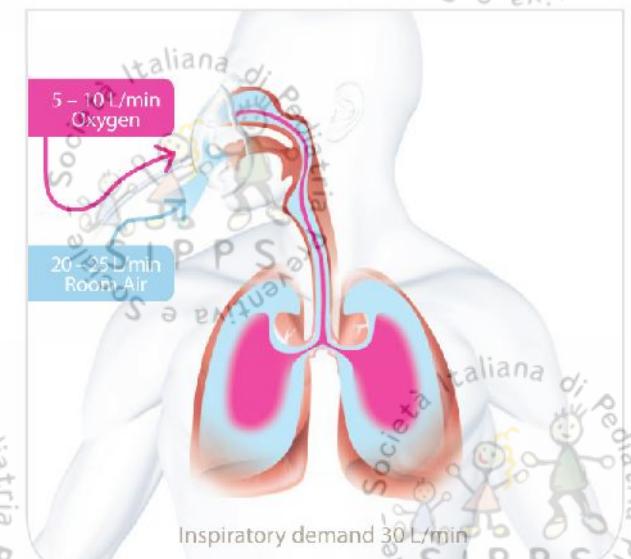

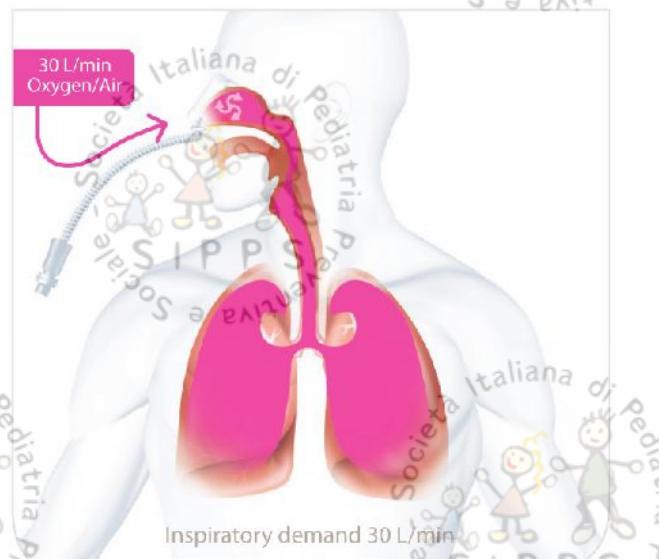

Key Action Statement 6b

Clinicians may choose not to use continuous pulse oximetry for infants and children with a diagnosis of bronchiolitis (Evidence Quality: C; Recommendation Strength: Weak Recommendation [based on lower-level evidence]).

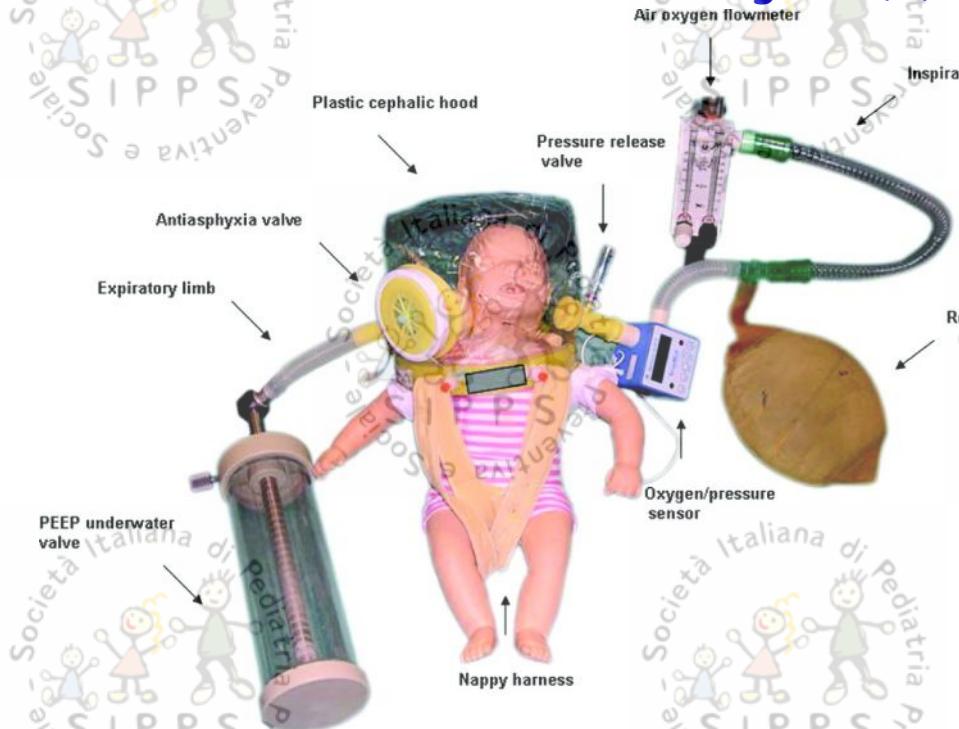

Nasal High Flow (NHF™)

1. Deliver up to 100% oxygen accurately
2. Flushing of anatomical dead space
3. Positive airway pressure throughout the respiratory cycle
4. Optimized mucociliary clearance

Noninvasive continuous positive airway pressure in acute respiratory failure: helmet versus facial mask. Chidini G, Calderini E, Cesana BM, Gandini C, Prandi E, Pelosi P. Pediatrics. 2010 Aug;126(2):e330-6. Epub 2010 Jul 26

R. Cutrera, 2016 renato.cutrera@opbg.net

Nutrizione - Idratazione

- ✓ dieta abituale: latte materno o formula, pasti solidi appropriati per l'età
- ✓ Sospendere alimentazione se:
 - polipnea > 80/min
 - vomito persistente
 - ipossia (<90%) durante il pasto
 - aumento lavoro respiratorio

- ✓ fluidoterapia e.v. o sondino n.g. se disidratazione
- ✓ No accesso venoso e fluidoterapia di routine
- ✓ peso giornaliero

November 1, 2014, Volume 134, Issue 5

Clinical Practice Guideline: The Diagnosis, Management, and Prevention of Bronchiolitis

NUTRITION AND HYDRATION

Key Action Statement 9

Clinicians should administer nasogastric or intravenous fluids for infants with a diagnosis of bronchiolitis who cannot maintain hydration orally (Evidence Quality: X; Recommendation Strength: Strong Recommendation).

Domande

Lo ricovero? Si

Ossigeno? No, ma controllo frequente

Lo metto in flebo? Si o sondino n.g.

Lo tratto con Salbutamolo? Adrenalina?

Summary on Bronchodilators

National Guideline Clearinghouse
www.guideline.gov

American Academy of Pediatrics
DEDICATED TO THE HEALTH OF ALL CHILDREN®

- It is recommended that serial albuterol aerosol therapies **not be routinely used**.
- It is recommended that a single administration trial inhalation using albuterol may be considered as an option, particularly when there is a family history for allergy, asthma, or atopy.
- It is recommended that inhalation therapy **not be repeated nor continued if there is no improvement in clinical appearance between 15 to 30 minutes after a trial inhalation therapy**.

- should not be used routinely in the management of bronchiolitis
- should be continued only if there is a documented positive clinical response
- not evidence that the use of bronchodilators is beneficial in shortening duration of illness or length of hospital stay
- in selected infants, there is an improvement in the clinical condition after bronchodilator administration.

- Inhaled β -2-agonist bronchodilators and anticholinergics (nebulised ipratropium) are not recommended for treatment of acute bronchiolitis in infants.
- The use of bronchodilators had no effects on rate of hospitalisation or time to hospital discharge.

National Guideline Clearinghouse
www.guideline.gov

- It is recommended that a single administration trial inhalation using epinephrine may be considered as an option, particularly when there is a family history for allergy, asthma, or atopy
- It is recommended that inhalation therapy **not** be repeated nor continued if there is no improvement in clinical appearance between 15 to 30 minutes after a trial inhalation therapy

Summary on Epinephrine

American Academy of Pediatrics
DEDICATED TO THE HEALTH OF ALL CHILDREN®

2011

- "some potential for being efficacious"
- did not impact the overall course of the illness as measured by hospital length of stay
- There is insufficient evidence to support the use of epinephrine for the treatment of bronchiolitis among *inpatients*.
- There is some evidence to suggest that epinephrine may be favorable to salbutamol among *outpatients*.

- Nebulised epinephrine is not recommended

- did not affect overall clinical status, oxygen requirement, time to hospital discharge or rate of hospital readmission within one month, for infant hospitalised with acute bronchiolitis.

Clinical Practice Guideline: The Diagnosis, Management, and Prevention of Bronchiolitis

ALBUTEROL

Key Action Statement 2

Clinicians should not administer albuterol (or salbutamol) to infants and children with a diagnosis of bronchiolitis (Evidence Quality: B; Recommendation Strength: Strong Recommendation).

EPINEPHRINE

Key Action Statement 3

Clinicians should not administer epinephrine to infants and children with a diagnosis of bronchiolitis (Evidence Quality: B; Recommendation Strength: Strong Recommendation).

Domande

Lo ricovero? Si

Ossigeno? No, ma controllo frequente

Lo metto in flebo? Si

Lo tratto con Salbutamolo? Si

Provo il Salbutamolo e aspetto una mezz'ora per vedere se funziona? Meglio

Lo tratto con Adrenalina? Solo se devo trasferirlo aspettando il rianimatore / 118

Lo tratto con steroide?

Summary on Corticosteroids

National Guideline Clearinghouse
www.guideline.gov

American Academy of Pediatrics
DEDICATED TO THE HEALTH OF ALL CHILDREN™

SIGN

Evidence

- It is recommended that **steroid therapy not be given** (as inhalations, intravenously, orally, or intramuscularly)
- not be used routinely
- No benefits were found in either LOS or clinical score in infants and young children treated with systemic glucocorticoids as compared with placebo.

➤ Inhaled and oral corticosteroids are not recommended

➤ did not reduce LOS in previously well infants less than 12 months of age with acute bronchiolitis.

November 1, 2014, Volume 134, Issue 5

Clinical Practice Guideline: The Diagnosis, Management, and Prevention of Bronchiolitis

CORTICOSTEROIDS

Key Action Statement 5

Clinicians should not administer systemic corticosteroids to infants with a diagnosis of bronchiolitis in any setting (Evidence Quality: A; Recommendation Strength: Strong Recommendation).

Domande

Lo ricovero? Si

Ossigeno? No, ma controllo frequente

Lo metto in flebo? Si

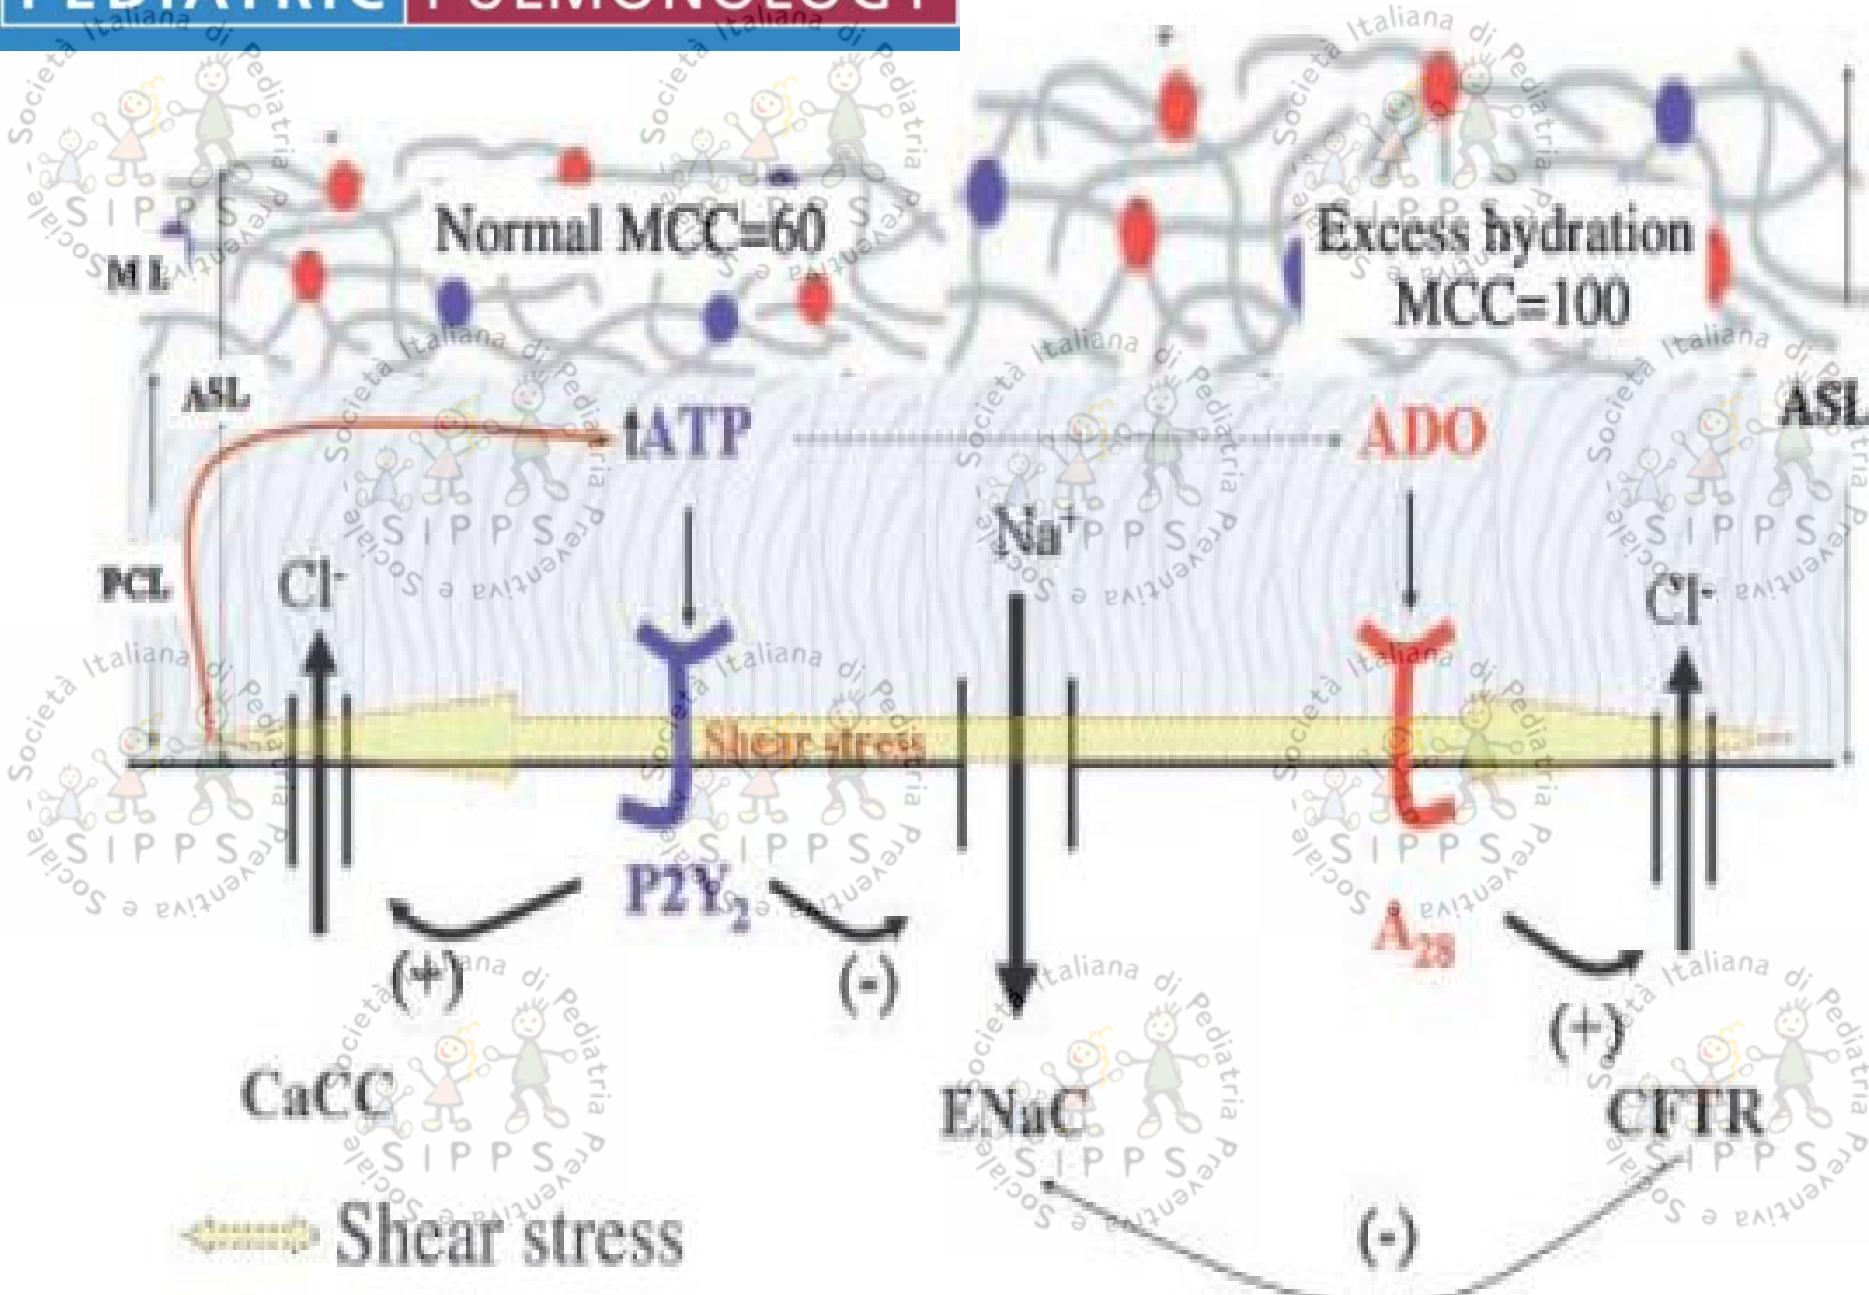

Lo tratto con Salbutamolo? NO - NO (USA)

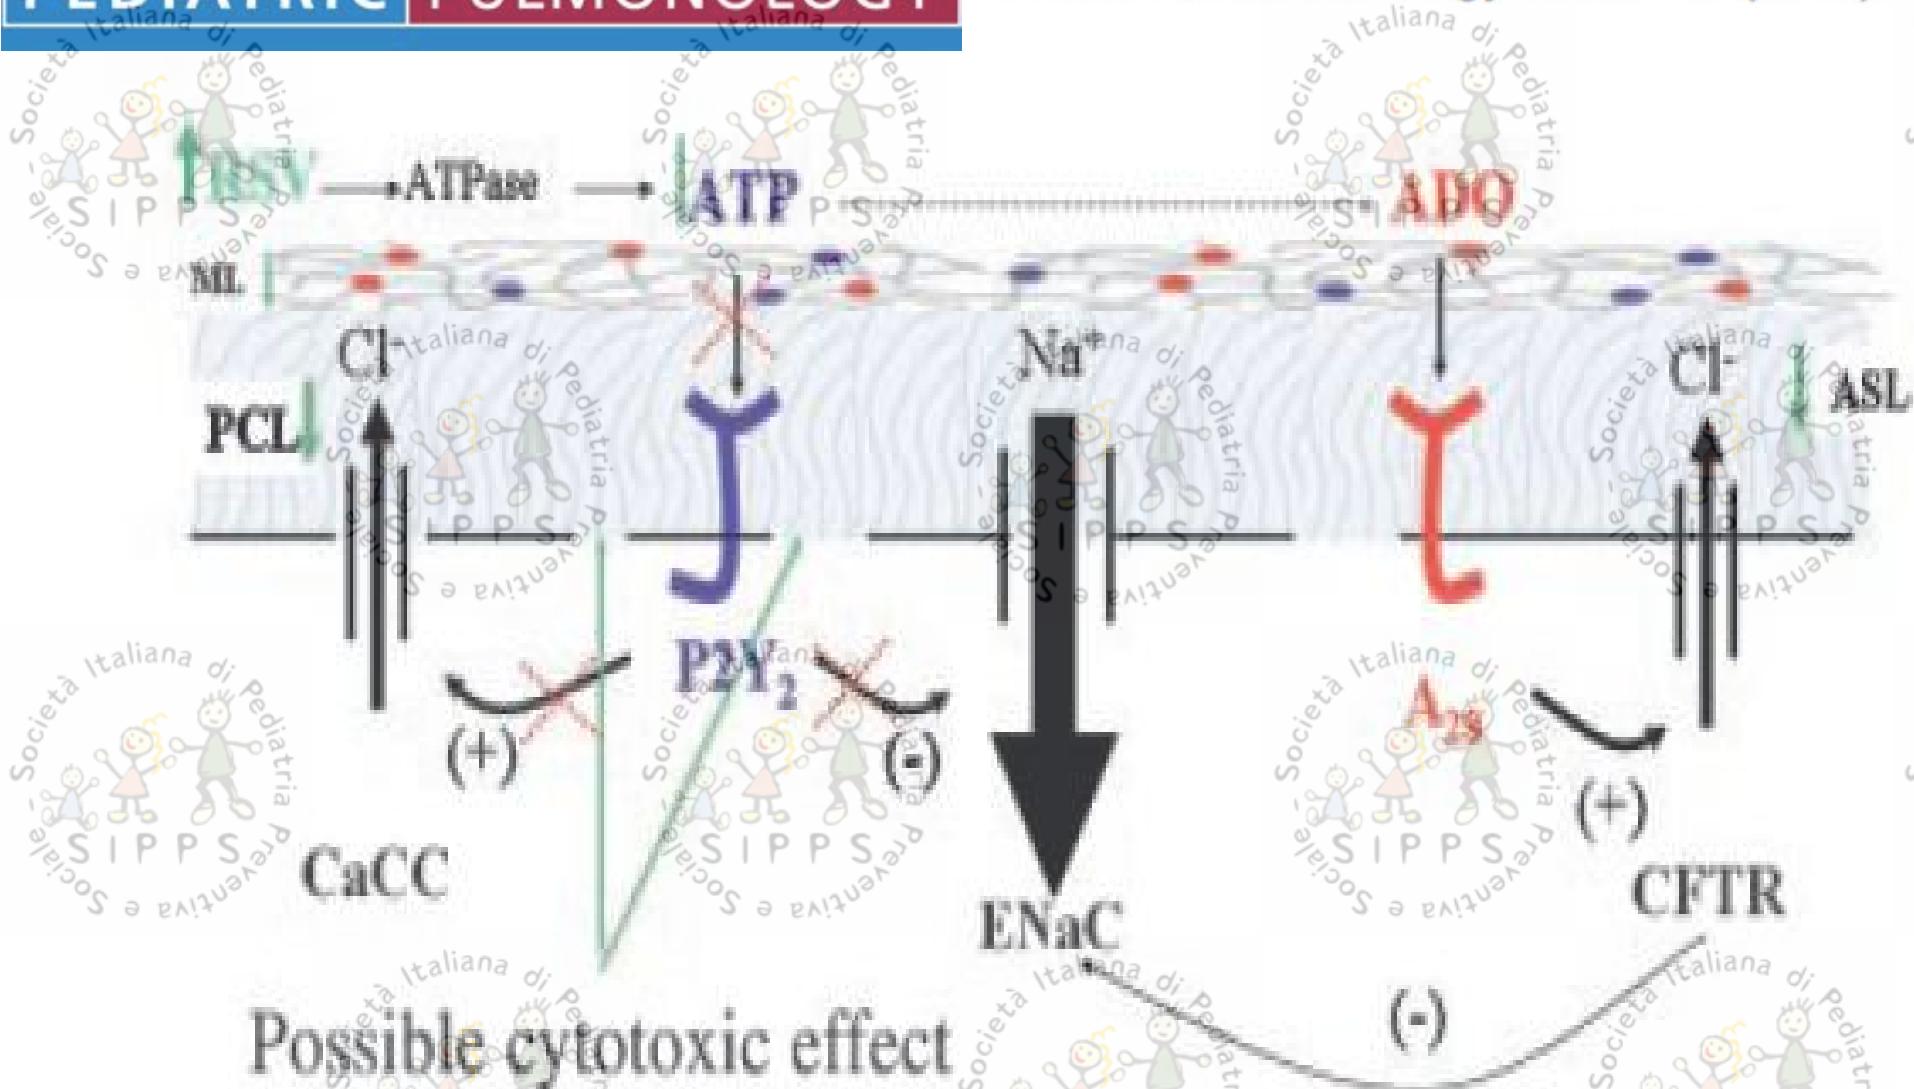

Provo il Salbutamolo e aspetto una mezz'ora per vedere se funziona? SI NO (USA)

Lo tratto con Adrenalina? Solo se devo trasferirlo aspettando il rianimatore

Lo tratto con steroide? No, in generale

E la soluzione salina ipertonica per inalazione?

Nebulized hypertonic saline solution for acute bronchiolitis in infants (Review)

Zhang L, Mendoza-Sassi RA, Wainwright C, Klassen TP

Implications for practice

Nebulized 3% saline produces a 1.2 day reduction in the mean length of hospital stay, compared to nebulized normal saline, among infants hospitalized with non severe viral bronchiolitis.

This therapy also significantly reduces clinical severity score, among outpatients and inpatients with mild to moderate viral bronchiolitis.

Given the clinically relevant benefit and good safety profile, nebulized 3% saline used in conjunction with bronchodilators should be considered an effective and safe treatment for infants with viral bronchiolitis.

November 1, 2014, Volume 134, Issue 5

Clinical Practice Guideline: The Diagnosis, Management, and Prevention of Bronchiolitis

HYPERTONIC SALINE

Key Action Statement 4a

Nebulized hypertonic saline should not be administered to infants with a diagnosis of bronchiolitis in the emergency department (Evidence Quality: B; Recommendation Strength: Moderate Recommendation).

NO

Key Action Statement 4b

Clinicians may administer nebulized hypertonic saline to infants and children hospitalized for bronchiolitis (Evidence Quality: B; Recommendation Strength: Weak Recommendation [based on randomized controlled trials with inconsistent findings]).

SI

Inter-society consensus document on treatment and prevention of bronchiolitis in newborns and infants

¹Bambino Gesù Scientific Institute, Rome, Italy

Treatment of bronchiolitis

Supportive therapy

Oxygen therapy

If O₂Sat < 90-92%

Safe and effective

Recommended

Nebulized 3% hypertonic saline

Respiratory physical therapy during acute phase of disease

Not effective

Environment humidification

Insufficient evidence

Pharmacological therapy

Nebulized Beta 2-agonists

Not effective (the possibility of a therapeutic trial of salbutamol is contemplated)

Nebulized adrenaline

Decreases hospitalizations in patients presenting to ER

Nebulized and systemic steroids

Not effective

Nebulized adrenaline + systemic steroids

Further studies are necessary

Antibiotics

Only in selected cases (bacterial co-infection/pre-existing diseases)

Ribavirin

Only in selected cases (severe forms/pre-existing diseases)

Nebulized DNase

Not effective

Montelukast

Apparently not effective

From: Association Between Hypertonic Saline and Hospital Length of Stay in Acute Viral Bronchiolitis: A Reanalysis of 2 Meta-analyses

JAMA Pediatr. Published online April 18, 2016. doi:10.1001/jamapediatrics.2016.0079

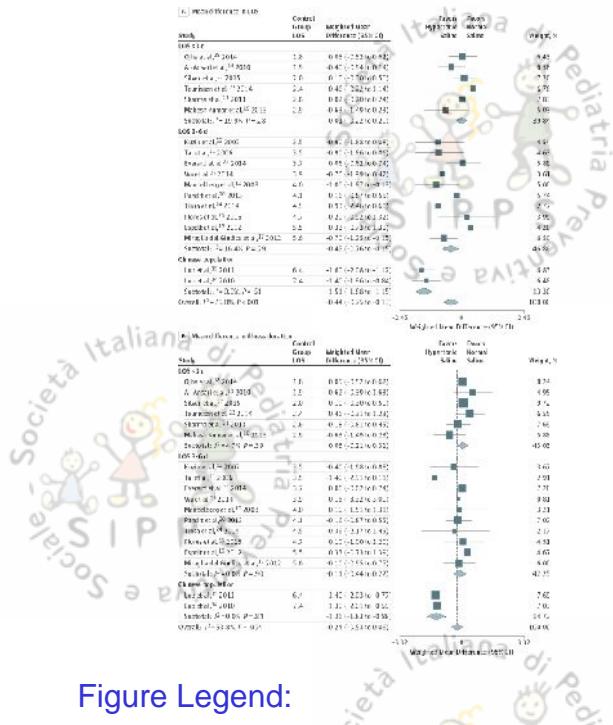

Figure Legend:

Mean Differences in Length of Stay (LOS) and Illness Duration Between Hypertonic Saline (HS) and Normal Saline (NS) Treatment Groups Subgroup analysis postulating a threshold response for LOS of 3 days or more. A, Admission to discharge. No correction for imbalance in day of illness at presentation. B, First symptoms to discharge. Corrected for imbalance in day of illness at presentation. WMD indicates weighted mean difference. Weights are from random effects analysis.

Bronchiolitis: diagnosis and management of bronchiolitis in children

Bronchiolitis in children

Clinical Guideline NG 9
Methods, evidence and recommendations
Monday 1st June, 2015

Final draft
Commissioned by the National Institute for Health and Care Excellence

Do not use any of the following to treat bronchiolitis in children:

- antibiotics
- hypertonic saline
- adrenaline (nebulised)
- salbutamol
- montelukast
- ipratropium bromide
- systemic or inhaled corticosteroids
- a combination of systemic corticosteroids and nebulised adrenaline

Bronchiolitis: diagnosis and management of bronchiolitis in children

Bronchiolitis in children

Clinical Guideline NG 9
Methods, evidence and recommendations
Monday 1st June, 2015

Final draft
Commissioned by the National Institute for Health and Care Excellence

Think about a diagnosis of viral-induced wheeze or early-onset asthma

rather than bronchiolitis in older infants and young children if they have:

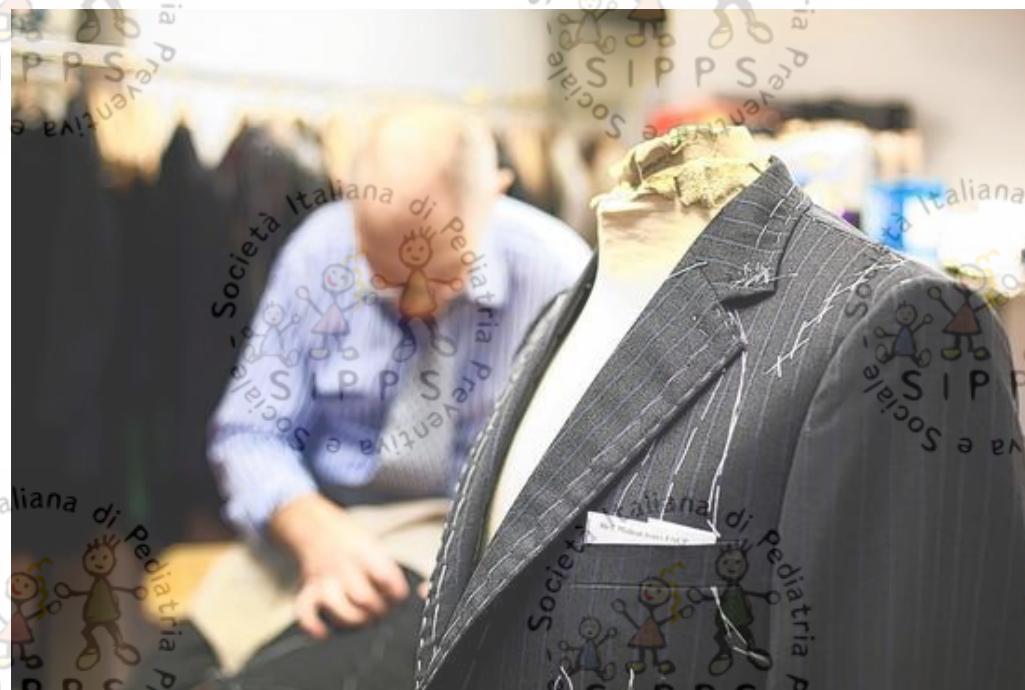

- persistent wheeze without crackles or
- recurrent episodic wheeze or
- a personal or family history of atopy.

Take into account that these conditions are unusual in children under 1 year of age

Personalized
Predictive
Participatory
Preemptive
